

3) Assume that there are 3 floors and 4 rooms in each floor. Design the vacuum cleaner to ensure the rooms are clean. You may make suitable assumption for initial state.

Program:

```
floor = [[1,0,0,0],
         [0,1,0,1],
         [1,0,1,1]]
def clean(floor):
    m = len(floor[0]) # no of cols
    n = len(floor) # no of rows
    no_of_tiles = m * n
    tiles_checked = 0
    row = 0
    col = 0
    while tiles_checked < no_of_tiles:
        # Current position
        print_floor(floor, row, col)
        # Suck if dirty
        if floor[row][col] == 1:
            floor[row][col] = 0
            print('Sucked the dirt')
        else:
            print('Already Clean')
        # Next tile
        if row % 2 == 0:
            if col < m-1:
                col += 1
            else:
                row += 1
        elif row % 2 == 1:
            if 0 < col:
                col -= 1
```
